

The healthcare industry is at a crisis point. Faced with escalating costs, inconsistent quality, a critical shortage of skilled workers and an increasing demand for services, both providers and payers are looking for innovative ways to increase operating margins, reduce costs and improve quality and safety — while increasing access to care. The pressure on service delivery and operating margins only intensified when millions of patients were added to the rosters of providers due to the implementation of the Affordable Care Act (ACA). There is no hope of a letup anytime soon as millions more baby boomers reach retirement age, a time when their need for healthcare services intensifies. Despite their individual missions, the goals of most healthcare providers tend to align along the same axis: reduce costs, improve care quality and promote access and transparency. In addition to these external impacts on the healthcare system, the industry realizes the need to transition from fee-for-service (FFS) to value-based care. They realized they must embrace outcomes-based healthcare in order to survive the transition to value-based care. We can help.

For the past 20 years, Denysys has helped many providers, large and small, select and implement the right technology to help them achieve the goals and missions of their respective organizations. As senior managers become more focused on the profitability of their organizations or the need to perform within their budgets, in the case of governmental or nonprofit organizations, they become more concerned with the key performance metrics that drive their organizations to success.

Denysys can help you identify and keep track of what's important.
SOME CRITICAL DATA POINTS INCLUDE:

1

Tracking and monitoring revenue, margins and operational performance

2

Analyzing results, identifying trends, detecting patterns and predicting outcomes

3

Modeling the impact of business decisions and improving financial processes

4

Monitoring quality initiatives and care programs

5

Supporting pay for performance goals and initiatives

6

Adjusting plans quickly to meet financial and other objectives and supporting profitable growth

7

Gaining an enterprise-wide view of performance against organizational goals, key performance indicators (KPIs) & strategic objectives

The first wave of the modernization of healthcare organizations was the widespread implementation of Electronic Health Records (EHR). Coupled with BI tools, organizational data can be messaged to the most granular level. One of the next major challenges healthcare organizations face, is to analyze this data to discern patterns and make that information available to decision makers, so that decisions are rooted in verifiable information.

Finally, we can help you consolidate the large data volumes your organization amasses. As we know, this is a huge challenge. It is especially difficult given that there are many tools used to analyze and report on the data, creating more islands of information.

Reporting and analysis consolidates your critical data and turns it into meaningful information and reports that everyone can use. You can quickly spot trends and drill down to discover underlying causes and issues your organization may have. The flexible, user-friendly reporting means everyone has the right information delivered in the right way—across all departments, service lines, locations, functions and roles.
